# The pdfrender package

# Heiko Oberdiek\* <heiko.oberdiek at googlemail.com>

# 2016/05/17 v1.4

#### Abstract

The PDF format has some graphics parameter like line width or text rendering mode. This package provides an interface for setting these parameters.

#### 1 Documentation

This package pdfrender defines an interface for PDF specific parameters that affects the rendering of graphics or text. The interface and its implementation uses the same technique as package color for color settings. Therefore this package is loaded to enable LATEX's color interface.

At different places LaTeX uses \normalcolor to avoid that header, footer or floats are print in the current color of the main text. \setgroup@color is used to start a save box with the color that is set at box saving time. Package pdfrender extends these macros to add its own hooks of its parameters. Therefore LaTeX3 should generalize LaTeX2  $_{\mathcal{E}}$ 's color interface.

#### 1.1 Usage

In LATEX the package is loaded as normal package. Options are not defined for this package.

```
\usepackage{pdfrender}
```

This package can also be used in plain TFX and even iniTFX:

input pdfrender.sty

#### 1.2 Macros

```
\pdfrender \{\langle key \ value \ list \rangle\}
```

The first parameter  $\langle key\ value\ list \rangle$  contains a list of parameter settings. The key entry is the parameter name. The macro works like \color (without optional argument) for color setting.

```
\textpdfrender \{\langle key\ value\ list \rangle\}\ \{\langle text \rangle\}
```

In the same way as  $\protect\$ 

#### 1.3 Parameters

The following table shows an overview for the supported parameters and values:

Parameter	Value	Alias
TextRenderingMode	0	Fill
	1	Stroke
	2	FillStroke
	3	Invisible
	4	FillClip
	5	StrokeClip
	6	FillStrokeClip
	7	Clip
LineWidth	positive number,	T <sub>E</sub> X dimen
	$unit\ is\ bp$	
LineCapStyle	0	Butt
	1	Round
	2	ProjectingSquare
LineJoinStyle	0	Miter
	1	Round
	2	Bevel
MiterLimit	$positive\ number$	
Flatness	number between 0	and 100
LineDashPattern	numbers in square brackets,	
	followed by n	umber,
	$units \ are \ bp$	
RenderingIntent	AbsoluteColorimetric	
	RelativeColorimetric	
	Saturation	
	Perceptual	
FillColor		$color\ specification$
StrokeColor		color specification

#### 1.3.1 Details

The description and specification of these parameters are available in the PDF specification [1]. Therefore they are not repeated here.

**Value:** The values in the second column lists or describe the values that are specified by the PDF specification.

Alias: Instead of magic numbers the package also defines some aliases that can be given as value. Example: LineCapStyle=Round has the same effect as LineCapStyle=1.

**Number:** The term *number* means an integer or real number. The real number is given as plain decimal number without exponent. The decimal separator is a period. At least one digit must be present.

**LineWidth:** As alias a TEX dimen specification can be given. This includes explicit specifications with number and unit, e.g. LineWidth=0.5pt. Also IATEX length registers may be used. If  $\varepsilon$ -TEX's \dimexpr is available, then it is automatically added. However package calc is not supported.

FillColor, StrokeColor: Package color or xcolor must be loaded before these options can be used (since version 1.2). LaTeX's color support sets both colors at the same time to the same value. However parameter TextRenderingMode offers the value FillStroke that makes only sense, if the two color types can

be set separately. If one of the options FillColor or StrokeColor is specified, then also the color is set. For compatibility with the LATEX color packages (color or xcolor), always both colors must be set. Thus if one of them is not specified, it is taken from the current color.

Both options FillColor and StrokeColor expect a LaTeX color specification as value. Also the optional color model argument is supported. Example:

```
FillColor=yellow,
StrokeColor=[cmyk]{1,.5,0,0}
```

#### 1.4 Color stack

If the pdfTEX version provides color stacks, then each parameter is assigned a page based color stack. The assignment of a stack takes place, when its parameter is set the first time. This avoids the use of color stacks that are not needed.

# 2 Implementation

```

#### 2.3 Hook into \normalcolor

The problem is that packages color and xcolor each overwrite \normalcolor. For example, after the package loading order color, pdfrender and xcolor the patched version of \normalcolor is overwritten by package xcolor. Also using \AtBeginDocument for patching is not enough. If package hyperref is loaded later, it might load package color using \AtBeginDocument.

```
load package color using \AtBeginDocument.

```

#### 4 Installation

#### 4.1 Download

**Package.** This package is available on CTAN<sup>1</sup>:

CTAN:macros/latex/contrib/oberdiek/pdfrender.dtx The source file.

CTAN:macros/latex/contrib/oberdiek/pdfrender.pdf Documentation.

**Bundle.** All the packages of the bundle 'oberdiek' are also available in a TDS compliant ZIP archive. There the packages are already unpacked and the documentation files are generated. The files and directories obey the TDS standard.

CTAN:install/macros/latex/contrib/oberdiek.tds.zip

TDS refers to the standard "A Directory Structure for TEX Files" (CTAN:tds/tds.pdf). Directories with texmf in their name are usually organized this way.

#### 4.2 Bundle installation

**Unpacking.** Unpack the oberdiek.tds.zip in the TDS tree (also known as texmf tree) of your choice. Example (linux):

```
unzip oberdiek.tds.zip -d ~/texmf
```

 $<sup>^{1}</sup>$ http://ctan.org/pkg/pdfrender

Script installation. Check the directory TDS:scripts/oberdiek/ for scripts that need further installation steps. Package attachfile2 comes with the Perl script pdfatfi.pl that should be installed in such a way that it can be called as pdfatfi. Example (linux):

```
chmod +x scripts/oberdiek/pdfatfi.pl
cp scripts/oberdiek/pdfatfi.pl /usr/local/bin/
```

#### 4.3 Package installation

Unpacking. The .dtx file is a self-extracting docstrip archive. The files are extracted by running the .dtx through plain T<sub>F</sub>X:

```
tex pdfrender.dtx
```

**TDS.** Now the different files must be moved into the different directories in your installation TDS tree (also known as texmf tree):

```
pdfrender.sty \rightarrow tex/generic/oberdiek/pdfrender.sty \\ pdfrender.pdf \rightarrow doc/latex/oberdiek/pdfrender.pdf \\ test/pdfrender-test1.tex \rightarrow doc/latex/oberdiek/test/pdfrender-test1.tex \\ test/pdfrender-test2.tex \rightarrow doc/latex/oberdiek/test/pdfrender-test2.tex \\ test/pdfrender-test3.tex \rightarrow doc/latex/oberdiek/test/pdfrender-test3.tex \\ test/pdfrender-test4.tex \rightarrow doc/latex/oberdiek/test/pdfrender-test4.tex \\ test/pdfrender-test5.tex \rightarrow doc/latex/oberdiek/test/pdfrender-test5.tex \\ pdfrender.dtx \rightarrow source/latex/oberdiek/pdfrender.dtx \\ \\
```

If you have a docstrip.cfg that configures and enables docstrip's TDS installing feature, then some files can already be in the right place, see the documentation of docstrip.

#### 4.4 Refresh file name databases

If your  $T_EX$  distribution (te $T_EX$ , mik $T_EX$ , ...) relies on file name databases, you must refresh these. For example, te $T_EX$  users run texhash or mktexlsr.

#### 4.5 Some details for the interested

Unpacking with LATEX. The .dtx chooses its action depending on the format:

plain TEX: Run docstrip and extract the files.

LATEX: Generate the documentation.

If you insist on using  $\LaTeX$  for docstrip (really, docstrip does not need  $\LaTeX$ ), then inform the autodetect routine about your intention:

```
latex \let\install=y\input{pdfrender.dtx}
```

Do not forget to quote the argument according to the demands of your shell.

Generating the documentation. You can use both the .dtx or the .drv to generate the documentation. The process can be configured by the configuration file ltxdoc.cfg. For instance, put this line into this file, if you want to have A4 as paper format:

```
\PassOptionsToClass{a4paper}{article}
```

An example follows how to generate the documentation with pdfLAT<sub>E</sub>X:

```
pdflatex pdfrender.dtx
makeindex -s gind.ist pdfrender.idx
pdflatex pdfrender.dtx
makeindex -s gind.ist pdfrender.idx
pdflatex pdfrender.dtx
```

# 5 Catalogue

The following XML file can be used as source for the TEX Catalogue. The elements caption and description are imported from the original XML file from the Catalogue. The name of the XML file in the Catalogue is pdfrender.xml.

```
1002 (*catalogue)
1003 <?xml version='1.0' encoding='us-ascii'?>
1004 <!DOCTYPE entry SYSTEM 'catalogue.dtd'>

```

# 6 Acknowledgement

**Friedrich Vosberg** asked in the newsgroup de.comp.text.tex for the font outline feature [2].

Gaius Pupus proposed the basic method using \pdfliteral in this thread [3].

Rolf Niepraschk added color support [4].

# 8 History

#### [2010/01/26 v1.0]

• The first version.

#### [2010/01/27 v1.1]

- Macros \pdfrender and \textpdfrender are made robust.
- Color extraction rewritten for the case that \pdfmatch is not available. This fixes wrong color assignments in case of nesting.
- Color extraction of case \pdfmatch is fixed for the case that the color string contains several fill or several stroke operations.

# [2010/01/28 v1.2]

- Dependency from package color is removed.
- Compatibility for plain TEX and even iniTEX added.

# [2016/05/14 v1.3]

• Use package luatex85 for compatibility with new LuaTeX.

#### [2016/05/17 v1.4]

- Documentation updates.
- adjust luatex85 reference so that it works in plain TeX.

#### 9 Index

Numbers written in italic refer to the page where the corresponding entry is described; numbers underlined refer to the code line of the definition; plain numbers refer to the code lines where the entry is used.
